E3 Displays Ships First Production Units of Enhanced LCD Displays for Military Application

Phoenix, Arizona, August 21, 2009

E3 Displays (E3D), a leading innovator and full service manufacturer of advanced custom LCD displays, announced that they have completed shipment of initial units of enhanced 15.4" LCD displays to be used by the United States military.

The display utilizes E3D's proprietary suite of optical adhesives and their unique optical bonding process, as well as the most recent technology in coatings and filters. Prior to production, qualification units were thoroughly tested under harsh environmental conditions, including extreme temperature ranges from -32C to 71C, temperature cycling, humidity, rain, shock and vibration, sand and dust, UV exposure and altitude, as well as electro-magnetic interference. Military representatives were impressed not only with the display's performance in MIL-810F testing, but also by its brilliance and sunlight readability.

E3D's initial shipment of this technologically advanced 15.4" enhanced display was considered a top priority throughout the company. E3D president Chuck Rahrig states, "E3 Displays is excited to be part of this project. We consider it an honor to be chosen as supplier of such a critical product for the men and women of our armed forces. It is imperative that they receive displays of the highest quality which utilize the most recent technological advancements. For military applications, our focus is to provide our troops with superior, reliable tools so that they can complete their mission as quickly as possible."

The program will exceed 2,000 units over the next two years.

In addition to the display, E3D will provide its client with LCD design/engineering consultation and support in business development opportunities.

Production of the displays will take place in E3D's ISO certified facility located in Tempe, Arizona. This manufacturing site includes display and electronics integration assembly, as well as a clean room for display enhancements.

About E3 Displays

E3D is a display engineering and manufacturing company which works with OEM/ODM customers in the avionics, marine, military, industrial, automotive and medical electronics industries to define, design and produce customized flat panel display systems and components.

Display enhancements include the complete re-design of the backlight optics system, integrating electronics and mechanical assemblies, and improving the front screen performance using anti-reflective, anti-glare or EMI filter glass or incorporating touch panel technology. Production of such enhanced displays has resulted in the engineering and development of non-silicone based, UV curable adhesives possessing superior optical clarity and "non-yellowing" characteristics.
